PELVIC ULTRASOUND

Transabdominal imaging has been performed.

The uterus is anteverted, in the midline and measures 10.6 x 5.8 x 7.2cm. There are multiple (at least five) fibroids in the uterine body. The largest fibroid measures 18mm in the left uterine body, in the lateral aspect. No other focal myometrial abnormality is visualised.

The endometrial echocomplex is of uniform and homogeneous echotexture and measures up to 14mm in thickness. No definite focal echogenic area seen within the endometrial cavity.

The right ovary has a volume of 4.1cc. The left ovary has a volume of 1.7cc.

There is no significant cyst formation in either ovary.

No abnormal adnexal masses are demonstrated and there is no free fluid in the pelvis.

COMMENT:

- 1. Multiple (at least five) fibroids in the uterine body, with the largest fibroid measuring up to 18mm in the left lateral wall.
- 2. The endometrium is not thickened measured up to 14mm. No evidence of endometrial polyp.
- 3. The remainder of the study is within normal limits.

Yours sincerely,

Dr. Prasad Kundum MBBS MD FRANZCR
